1. Intended Use

The RealStar® Dengue RT-PCR Kit 3.0 is an *in vitro* diagnostic test, based on real-time PCR technology, for the qualitative detection of dengue virus (DENV) specific RNA.

3. Storage

- The RealStar® Dengue RT-PCR Kit 3.0 is shipped on dry ice. The components of the kit should arrive frozen. If one or more components are not frozen upon receipt, or if tubes have been compromised during shipment, contact altona Diagnostics GmbH for assistance.
- All components should be stored between -25°C and -15°C upon arrival.
- Repeated thawing and freezing of Master reagents (more than twice) should be avoided, as this might affect the performance of the assay. The reagents should be frozen in aliquots, if they are to be used intermittently.
- Storage between +2°C and +8°C should not exceed a period of two hours.
- Protect Master A and Master B from light.
4. **Material and Devices required but not provided**

- Appropriate real-time PCR instrument (see chapter 6.1 Real-Time PCR Instruments)
- Appropriate nucleic acid extraction system or kit (see chapter 8.1 Sample Preparation)
- Desktop centrifuge with a rotor for 2 ml reaction tubes
- Centrifuge with a rotor for microtiter plates, if using 96 well reaction plates
- Vortex mixer
- Appropriate 96 well reaction plates or reaction tubes with corresponding (optical) closing material
- Pipettes (adjustable)
- Pipette tips with filters (disposable)
- Powder-free gloves (disposable)

**NOTE**

*Please ensure that all instruments used have been installed, calibrated, checked and maintained according to the manufacturer’s instructions and recommendations.*

**NOTE**

*It is highly recommended to use the 72-well rotor with the appropriate 0.1 ml reaction tubes, if using the Rotor-Gene® 6000 (Corbett Research) or the Rotor-Gene® Q 5/6 plex (QIAGEN).*
5. Background Information

The Dengue virus (DENV) is a species of the genus Flavivirus, which is part of the family Flaviviridae. This species can be divided into four known serotypes DENV-1, DENV-2, DENV-3 and DENV-4. [1] The genome consists of positive single-stranded RNA, about 10.7 kb in length, which is enveloped by a nucleocapsid, and covered by a lipid envelope. [2]

DENV is an arbovirus, transmitted by female mosquitoes of the Aedes species. This particular mosquito species was originally endemic in Asia, however spreading rapidly throughout North and South America, Africa, Europe and Australia, as well as to several islands in the Pacific and Indian Ocean, in our present time. [4] In these regions more than 50 million people are infected with DENV every year, of which approximately 24,000 succumb to the infection. Therefore, DENV is one of the most threatening mosquito-transmitted viral pathogens for human beings. The DENV pathogenicity is mainly associated with the envelope protein that mediates the binding and entry of the virus into the host cell. Furthermore, this protein influences immune reactions of the host, causing cell damage. [3] DENV infections often cause unspecific symptoms including fever and severe joint pain, which usually disappear without complications after two to seven days. However, the infection can also lead to other, more severe conditions including Dengue hemorrhagic fever (DHF) and Dengue shock syndrome (DSS), which are often the result of sequential infections with multiple serotypes. [2]

When a DENV infection causes Dengue hemorrhagic fever (DHF), symptoms include high fever, circulatory failure and hemorrhagic phenomena. Furthermore, it is possible that patients develop an encephalitis, liver failure and myocarditis. Affected patients can also develop a shock they can succumb to, with drop of blood pressure and pulse.

On the other hand, DENV infections can also cause the Dengue shock syndrome (DSS), which is accompanied by plasma leakage and persisting vomiting, which can lead to a fatal shock. This syndrome is a very severe condition with a mortality rate of up to 47%. [3] Up till now, no specific treatment for DENV-infected patients is available, which is why patients can only be treated with supportive measures to
attenuate the symptoms and prevent them from shock. [5]

The clinical diagnosis of DENV infection may be challenging due to the often unspecific symptoms of infection. Therefore, laboratory verification of the diagnosis is essential. One of the most commonly used methods for virus detection is RT-PCR, a fast, sensitive and reliable method that can deliver results from the onset of the illness. [6]

An infection with one of the four serotypes of DENV does not confer cross-immunity to the other serotypes, so up to four DENV infections are possible, leaving patients in the endemic areas at particular risk. Secondary infections with other serotypes often lead to the development of more severe conditions due to antibody-mediated enhancement effects. Therefore, much effort is necessary to develop a vaccine that mediates immunity against several or all serotypes simultaneously. However, the development of such a vaccine is challenging. Vaccine development hasn’t been successful so far because already existent antibodies cannot be neutralized fully against the other serotypes. [7]

6. Product Description

The RealStar® Dengue RT-PCR Kit 3.0 is an in vitro diagnostic test, based on real-time PCR technology, for the qualitative detection of dengue virus (DENV) specific RNA.

Real-time RT-PCR technology utilizes reverse-transcriptase (RT) reaction to convert RNA into complementary DNA (cDNA), polymerase chain reaction (PCR) for the amplification of specific target sequences and target specific probes for the detection of the amplified DNA. The probes are labelled with fluorescent reporter and quencher dyes.

Probes specific for DENV RNA are labelled with the fluorophore FAM™. The probe specific for the Internal Control (IC) is labelled with the fluorophore JOE™.

Using probes linked to distinguishable dyes enables the parallel detection of DENV specific RNA and the Internal Control in corresponding detector channels of the real-time PCR instrument.

The test consists of three processes in a single tube assay:

- Reverse transcription of target and Internal Control RNA to cDNA
- PCR amplification of target and Internal Control cDNA
- Simultaneous detection of PCR amplicons by fluorescent dye labelled probes
The RealStar® Dengue RT-PCR Kit 3.0 consists of:

- Two Master reagents (Master A and Master B)
- Internal Control (IC)
- Positive Control
- PCR grade water

Master A and Master B contain all components (PCR buffer, reverse transcriptase, DNA polymerase, magnesium salt, primers and probes) to allow reverse transcription, PCR mediated amplification and detection of DENV specific RNA and Internal Control in one reaction setup.

6.1 Real-Time PCR Instruments

The RealStar® Dengue RT-PCR Kit 3.0 was developed and validated to be used with the following real-time PCR instruments:

- Mx 3005P™ QPCR System (Stratagene)
- VERSANT® kPCR Molecular System AD (Siemens Healthcare)
- ABI Prism® 7500 SDS (Applied Biosystems)
- ABI Prism® 7500 Fast SDS (Applied Biosystems)
- Rotor-Gene® 6000 (Corbett Research)
- Rotor-Gene® Q5/6 plex Platform (QIAGEN)
- CFX96™ Real-Time PCR Detection System (Bio-Rad)
- CFX96™ Deep Well Real-Time PCR Detection System (Bio-Rad)
- LightCycler® 480 Instrument II (Roche)
7. Warnings and Precautions

Read the Instructions for Use carefully before using the product.

- Before first use check the product and its components for:
  - Integrity
  - Completeness with respect to number, type and filling (see chapter 2. Kit Components)
  - Correct labelling
  - Frozenness upon arrival

- Use of this product is limited to personnel specially instructed and trained in the techniques of real-time PCR and *in vitro* diagnostic procedures.

- Specimens should always be treated as infectious and/or biohazardous in accordance with safe laboratory procedures.

- Wear protective disposable powder-free gloves, a laboratory coat and eye protection when handling specimens.

- Avoid microbial and nuclease (DNase/RNase) contamination of the specimens and the components of the kit.

- Always use DNase/RNase-free disposable pipette tips with aerosol barriers.

- Always wear protective disposable powder-free gloves when handling kit components.

- Use separated and segregated working areas for (i) sample preparation, (ii) reaction setup and (iii) amplification/detection activities. The workflow in the laboratory should proceed in unidirectional manner. Always wear disposable gloves in each area and change them before entering a different area.

- Dedicate supplies and equipment to the separate working areas and do not move them from one area to another.

- Store positive and/or potentially positive material separated from all other components of the kit.

- Do not open the reaction tubes/plates post amplification, to avoid contamination with amplicons.
8. Procedure

8.1 Sample Preparation

Extracted RNA is the starting material for the RealStar® Dengue RT-PCR Kit 3.0.

The quality of the extracted RNA has a profound impact on the performance of the entire test system. It is recommended to ensure that the system used for nucleic acid extraction is compatible with real-time PCR technology. The following kits and systems are suitable for nucleic acid extraction:

- QIAamp® Viral RNA Mini Kit (QIAGEN)
- QIAsymphony® (QIAGEN)
- NucliSENS® easyMag® (bioMérieux)
- MagNA Pure 96 System (Roche)
- m2000sp (Abbott)
- Maxwell® 16 IVD Instrument (Promega)
- VERSANT® kPCR Molecular System SP (Siemens Healthcare)

Alternative nucleic acid extraction systems and kits might also be appropriate. The suitability of the nucleic acid extraction procedure for use with RealStar® Dengue RT-PCR Kit 3.0 has to be validated by the user.

If using a spin column based sample preparation procedure including washing buffers containing ethanol, it is highly recommended to perform an additional
centrifugation step for 10 min at approximately 17000 x g (~ 13000 rpm), using a new collection tube, prior to the elution of the nucleic acid.

### CAUTION

If your sample preparation system is using washing buffers containing ethanol, make sure to eliminate any traces of ethanol prior to elution of the nucleic acid. Ethanol is a strong inhibitor of real-time PCR.

### CAUTION

The use of carrier RNA is crucial for extraction efficiency and stability of the extracted nucleic acid.

For additional information and technical support regarding pre-treatment and sample preparation please contact our Technical Support (see chapter 14. Technical Assistance).

### 8.2 Master Mix Setup

All reagents and samples should be thawed completely, mixed (by pipetting or gentle vortexing) and centrifuged briefly before use.

The RealStar® Dengue RT-PCR Kit 3.0 contains a heterologous Internal Control (IC), which can either be used as a RT-PCR inhibition control or as a control of the sample preparation procedure (nucleic acid extraction) and as a RT-PCR inhibition control.
If the IC is used as a RT-PCR inhibition control, but not as a control for the sample preparation procedure, set up the Master Mix according to the following pipetting scheme:

<table>
<thead>
<tr>
<th>Number of Reactions (rxns)</th>
<th>1</th>
<th>12</th>
</tr>
</thead>
<tbody>
<tr>
<td>Master A</td>
<td>5 µl</td>
<td>60 µl</td>
</tr>
<tr>
<td>Master B</td>
<td>15 µl</td>
<td>180 µl</td>
</tr>
<tr>
<td>Internal Control</td>
<td>1 µl</td>
<td>12 µl</td>
</tr>
<tr>
<td><strong>Volume Master Mix</strong></td>
<td>21 µl</td>
<td>252 µl</td>
</tr>
</tbody>
</table>

If the IC is used as a control for the sample preparation procedure and as a RT-PCR inhibition control, add the IC during the nucleic acid extraction procedure.

No matter which method/system is used for nucleic acid extraction, the IC must not be added directly to the specimen. The IC should always be added to the specimen/lysis buffer mixture. The volume of the IC which has to be added, always and only depends on the elution volume. It represents 10% of the elution volume. For instance, if the nucleic acid is going to be eluted in 60 µl of elution buffer or water, 6 µl of IC per sample must be added into the specimen/lysis buffer mixture.

If the IC was added during the sample preparation procedure, set up according to the following pipetting scheme:

<table>
<thead>
<tr>
<th>Number of Reactions (rxns)</th>
<th>1</th>
<th>12</th>
</tr>
</thead>
<tbody>
<tr>
<td>Master A</td>
<td>5 µl</td>
<td>60 µl</td>
</tr>
<tr>
<td>Master B</td>
<td>15 µl</td>
<td>180 µl</td>
</tr>
<tr>
<td><strong>Volume Master Mix</strong></td>
<td>20 µl</td>
<td>240 µl</td>
</tr>
</tbody>
</table>
8.3 Reaction Setup

► Pipette 20 µl of the Master Mix into each required well of an appropriate optical 96-well reaction plate or an appropriate optical reaction tube.

► Add 10 µl of the sample (eluate from the nucleic acid extraction) or 10 µl of the controls (Positive or Negative Control).

<table>
<thead>
<tr>
<th>Reaction Setup</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Master Mix</td>
<td>20 µl</td>
</tr>
<tr>
<td>Sample or Control</td>
<td>10 µl</td>
</tr>
<tr>
<td><strong>Total Volume</strong></td>
<td><strong>30 µl</strong></td>
</tr>
</tbody>
</table>

► Make sure that at least one Positive and one Negative Control is used per run.

► Thoroughly mix the samples and controls with the Master Mix by pipetting up and down.

► Close the 96-well reaction plate with appropriate lids or optical adhesive film and the reaction tubes with appropriate lids.

► Centrifuge the 96-well reaction plate in a centrifuge with a microtiter plate rotor for 30 seconds at approximately 1000 x g (~ 3000 rpm).
9. Programming the Real-Time PCR Instrument

For basic information regarding the setup and programming of the different real-time PCR instruments, please refer to the user manual of the respective instrument.

For detailed programming instructions regarding the use of the RealStar® Dengue RT-PCR Kit 3.0 on specific real-time PCR instruments please contact our Technical Support (see chapter 14. Technical Assistance).

9.1 Settings

► Define the following settings:

<table>
<thead>
<tr>
<th>Settings</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reaction Volume</td>
<td>30 µl</td>
</tr>
<tr>
<td>Ramp Rate</td>
<td>Default</td>
</tr>
<tr>
<td>Passive Reference</td>
<td>ROX™</td>
</tr>
</tbody>
</table>

9.2 Fluorescence Detectors (Dyes)

► Define the fluorescence detectors (dyes):

<table>
<thead>
<tr>
<th>Target</th>
<th>Detector Name</th>
<th>Reporter</th>
<th>Quencher</th>
</tr>
</thead>
<tbody>
<tr>
<td>DENV specific RNA</td>
<td>DENV</td>
<td>FAM™</td>
<td>(None)</td>
</tr>
<tr>
<td>Internal Control (IC)</td>
<td>IC</td>
<td>JOE™</td>
<td>(None)</td>
</tr>
</tbody>
</table>
9.3 Temperature Profile and Dye Acquisition

Define the temperature profile and dye acquisition:

<table>
<thead>
<tr>
<th>Stage</th>
<th>Cycle Repeats</th>
<th>Acquisition</th>
<th>Temperature [°C]</th>
<th>Time [min:sec]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reverse Transcription</td>
<td>Hold</td>
<td>1</td>
<td>-</td>
<td>55</td>
</tr>
<tr>
<td>Denaturation</td>
<td>Hold</td>
<td>1</td>
<td>-</td>
<td>95</td>
</tr>
<tr>
<td>Amplification</td>
<td>Cycling</td>
<td>45</td>
<td>-</td>
<td>95</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>yes</td>
<td>55</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>-</td>
<td>72</td>
</tr>
</tbody>
</table>

10. Data Analysis

For basic information regarding data analysis on specific real-time PCR instruments, please refer to the user manual of the respective instrument.

For detailed instructions regarding the analysis of the data generated with the RealStar® Dengue RT-PCR Kit 3.0 on different real-time PCR instruments please contact our Technical Support (see chapter 14. Technical Assistance).

10.1 Validity of Diagnostic Test Runs

10.1.1 Valid Diagnostic Test Run (qualitative)

A qualitative diagnostic test run is valid, if the following control conditions are met:
Control ID | Detection Channel
---|---
 | FAM™ | JOE™
Positive Control | + | +/- *
Negative Control | - | +

* The presence or absence of a signal in the JOE™ channel is not relevant for the validity of the test run.

10.1.2 Invalid Diagnostic Test Run (qualitative)

A qualitative diagnostic test run is invalid, (i) if the run has not been completed or (ii) if any of the control conditions for a valid diagnostic test run are not met.

In case of an invalid diagnostic test run, repeat testing by using the remaining purified nucleic acids or start from the original samples again.

10.2 Interpretation of Results

10.2.1 Qualitative Analysis

Detection Channel | Result Interpretation
---|---
FAM™ | JOE™
+ | +* | DENV specific RNA detected.
- | + | No DENV specific RNA detected. Sample does not contain detectable amounts of DENV specific RNA.
- | - | RT-PCR inhibition or reagent failure. Repeat testing from original sample or collect and test a new sample.

* Detection of the Internal Control in the JOE™ detection channel is not required for positive results in the FAM™ detection channel. A high DENV RNA load in the sample can lead to a reduced or absent Internal Control signal.
11. Performance Evaluation

Performance evaluation of the RealStar® Dengue RT-PCR Kit 3.0 was done on genomic RNA of Dengue virus serotype 1.

11.1 Analytical Sensitivity

The analytical sensitivity of the RealStar® Dengue RT-PCR Kit 3.0 is defined as the concentration (copies/μl of the eluate) of DENV specific RNA molecules that can be detected with a positivity rate of 95%. The determination of the analytical sensitivity was carried out by a dilution series of Dengue virus-derived RNA.

Table 1: RT-PCR results used for the calculation of the analytical sensitivity with respect to the detection of DENV specific RNA

<table>
<thead>
<tr>
<th>Input Conc. [copies/μl]</th>
<th>Number of Replicates</th>

</tbody>
</table>

The analytical sensitivity of the RealStar® Dengue RT-PCR Kit 3.0 was determined by Probit analysis:

- For the detection of Dengue virus specific RNA, the analytical sensitivity is 7.04 copies/μl [95% confidence interval (CI): 4.37 - 15.39 copies/μl]
11.2 Analytical Specificity

Reactivity

The analytical specificity with respect to the reactivity of the RealStar® Dengue RT-PCR Kit 3.0 was evaluated by a panel of genomic RNA extracted from dengue virus serotypes.

The RealStar® Dengue RT-PCR Kit 3.0 is able to detect RNA of following dengue virus serotypes:

- Dengue virus 1
- Dengue virus 2
- Dengue virus 3
- Dengue virus 4

Cross Reactivity

The analytical specificity with respect to the cross reactivity of the RealStar® Dengue RT-PCR Kit 3.0 was evaluated by testing a panel of genomic RNA/DNA extracted from viruses related to Dengue virus and other organisms causing similar symptoms as Dengue virus.

The RealStar® Dengue RT-PCR Kit 3.0 did not cross-react with any of the following pathogens:

- Crimean-Congo hemorrhagic fever virus
- Chikungunya virus
- Ebola virus
- Hepatitis C virus
- Japanese encephalitis virus
- Lassa virus
- Marburg virus
- Murray Valley encephalitis virus
- Usutu virus
- West Nile virus
- Yellow fever virus
- Zika virus
- Plasmodium falciparum
11.3 Precision

Precision of the RealStar® Dengue RT-PCR Kit 3.0 was determined as intra-assay variability (variability within one experiment), inter-assay variability (variability between different experiments) and inter-lot variability (variability between different production lots). Total variability was calculated by combining the three analyses.

The variability data are expressed in terms of standard deviation and coefficient of variation based on threshold cycle (C<sub>t</sub>) values. At least six replicates per sample were analysed for intra-assay variability, inter-assay and inter-lot variability.

Table 2: Precision data for the detection of DENV specific RNA

12. Limitations

- Strict compliance with the Instructions for Use is required for optimal results.
- Use of this product is limited to personnel specially instructed and trained in the techniques of real-time PCR and in vitro diagnostic procedures.
- Good laboratory practice is essential for proper performance of this assay. Extreme care should be taken to preserve the purity of the components of the kit and reaction setups. All reagents should be closely monitored for impurity and contamination. Any suspicious reagents should be discarded.
- Appropriate specimen collection, transport, storage and processing procedures are required for the optimal performance of this test.
- This assay must not be used on the specimen directly. Appropriate nucleic acid extraction methods have to be conducted prior to using this assay.
- The presence of RT-PCR inhibitors (e.g. heparin) may cause false negative or invalid results.
- Potential mutations within the target regions of the DENV genome covered by the primers and/or probes used in the kit may result in failure to detect the presence of the pathogens.
- As with any diagnostic test, results of the RealStar® Dengue RT-PCR Kit 3.0 need to be interpreted in consideration of all clinical and laboratory findings.

13. Quality Control

In accordance with the altona Diagnostics GmbH ISO EN 13485-certified Quality Management System, each lot of RealStar® Dengue RT-PCR Kit 3.0 is tested against predetermined specifications to ensure consistent product quality.
